ABSTRACT

Despite the fact that sustainable development represents an overall increase in the standard of living it is interpreted with different priorities. The EU, creating its policies to aimed at improving living standards wherever possible, developing countries are giving priority to the economic development. In the energy area, the EU is rising environmental living standards by passing through nuclear energy to renewable energy. Turkey, both as a developing country and candidate country has sat the economic development on the basis of sustainable development. In this context, the nuclear energy has become a priority in the energy field. In the study, energy choices and the impact of these choices to the EU cohesion policy from the point of Turkey were examined depending on the interpret of sustainable development Turkey and the EU.
