ABSTRACT

Please insert the English abstract above (max. 250 words). As a result of traditional development methods' disrupting the balance of environment and economics against the nature, protecting the world's resources have been becoming significant. While economical development is reaching vertigious speed, environment problems' growing day by day receive the opinions that are in use to be given up and as a result of this the opinion of sustainable development that is seen as a global development method of 21st century is a social, economical and environmental development's being evaluated together and being provided an optimal balance among them. The ethic point of view is becoming a topic here. Environmental ethic is defining a broad concept that reaches the right of existing all the species and world's wholeness in the level of today and future's generation. The point of view thinking of future's needs for meeting today's needs is an ethic approach in terms of taking responsibility for the coming generation but in practice sustainable development may not be as ethical as in theory. In this study it is aimed that integrating the environmental ethic and the theory of sustainable development but also from the other side question the sustainable development's sustaining and evaluate whether it has problems in ethic terms. As a result of these, this study is going to be constructed in three parts. In the first part conceptual frame will be shown, in the second part the relation between sustainable development and ethic will be handled and in the last part the sustainable development will be questioned.

KEYWORDS Sustainable Development; Ethic; Environmental Ethic
